

Lightning Scars

by Noel Joshua Hadley

Lightning Scars

THE ROYAL Society and the Smithsonian Institute, as well as Jesuit sponsored learning institutions everywhere in the world, *also* park rangers, would have you know the Grand Canyon was formed 5 to 6 million years ago when the Colorado River slowly began to cut a channel through layers rock, one mile deep. *Ridiculous*. But you've probably been spoon fed that indoctrination already. It's why you're here. To scrub the bad taste out of your mouth. The young earth creationists come up with a good theory on their own. It has to do with Noah's flood. Everything has to do with Noah's flood in their own mind though. Quite the shame. So many lost opportunities. His-Story informs us there were far more reset events than the great deluge of Noah's day, and the Grand Canyon very likely appears to be one of them.

There are *other* theories. One is that the Grand Canyon was once a giant quarry. Interesting but untrue. *Sure*, there were giants in them parts

at one time. And I'm not here to dispute the claims that mummies and other goodies from the Egyptian treasury were secret carted away by Jesuits posing as U-Haul Movers. I'm willing to bet the Grand Canyon *was* a city at one time. No doubt a happening place. The entire high plateau region was probably a sprawling Metropolis. That's something which I aim to show over the *following* so many pages.

In review, evolutionists insist millions of years, hoping the magically unattainable number will make their story more credible, whereas the young earth creationists claim a single year for the Colorado River to do its work. What I'm *presently* saying is, neither the young earth creationists nor the Darwinians stick the landing. And that is because the Grand Canyon

cannot be explained by water erosion alone. There are too many rivers crisscrossing the other. That's not supposed to happen. Certainly not in a flood. *Sure*, keep coming at me with your *magic* and claim *gravity* had a part in it. Electrical scarring is another matter entirely. It seems entirely plausible that the formation of the Grand Canyon was a major electrical event. But it doesn't end there. We find the same sort of scarring all over the world. We'll get to that in a moment. But *first*...

This is what I'm talking about, right *here*. Negative electric discharge scarring. Two separate photos document two individual bodies. The left arm on the right and somebody else's backside on the left. Their thick branching redness was created due to the current from a nearby lightning strike. That much isn't disputed. And as you can clearly see, the electrical discharge created geometric patterns across their flesh. There's another name for that. The phenomenon is often referred to as a **treeing effect**.
